

CS-417 INTRODUCTION TO ROBOTICS AND INTELLIGENT SYSTEMS

Exploration

Ioannis Rekleitis

Three Main Challenges in Robotics

1. Where am I? (Localization)

- Sense
- relate sensor readings to a world model
- compute location relative to model
- assumes a perfect world model

2. What the world looks like? (Mapping)

- sense from various positions
- integrate measurements to produce map
- assumes perfect knowledge of position
- Together 1 and 2 form the problem of *Simultaneous Localization and Mapping* (SLAM)
- 3. How do I go from A to B? (Path Planning)
 - More general: Which action should I pick next?

Mapping

- What the world looks like
- Improve the accuracy of the map
- Ensure that all the important parts of the environment are mapped Exploration!

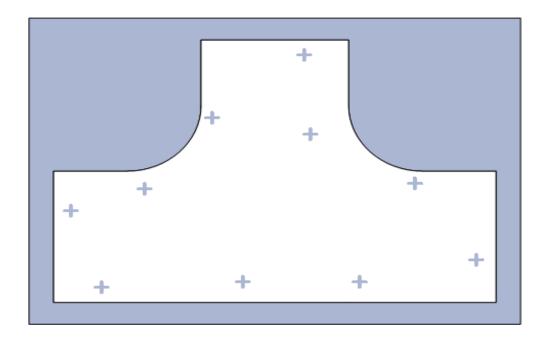

Environment Representation (Map)

- Grid Based Maps
- Feature Based Maps
- Topological Maps
- Hybrid Maps

Consider this Environment:

Three Basic Map Types

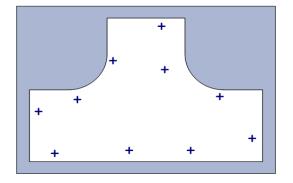

Grid-Based:

Collection of discretized obstacle/free-space pixels

								÷					
					+								
								+					
				ſ									
			+							+			
+													
												1-	
	-	-				+			÷				

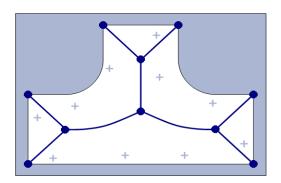

Feature-Based:

Collection of landmark locations and correlated uncertainty

Topological:

Collection of nodes and their interconnections

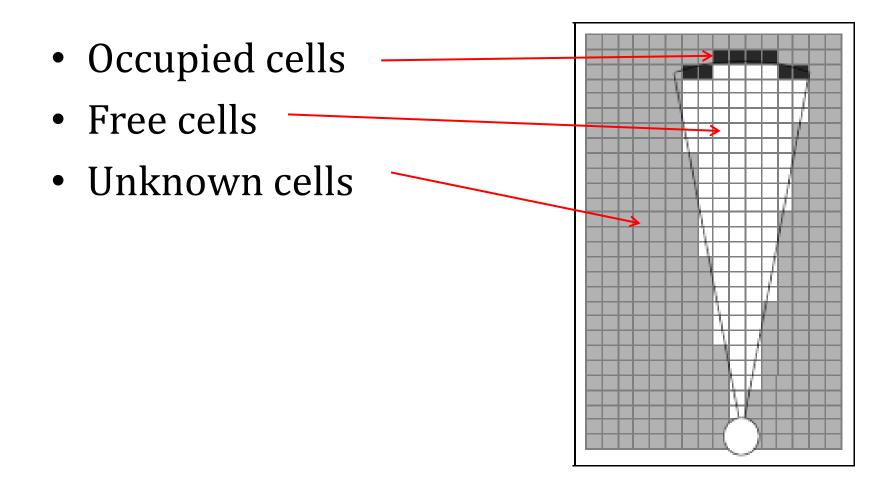

Three Basic Map Types

		+ + + + +	+ + + + + + + + + + + + + + + + + + + +		
	Grid-Based	Feature-Based	Topological		
Construction	Occupancy grids	Kalman Filter	Navigation control laws		
Complexity	Grid size and resolution	Landmark covariance (N ³)	Minimal complexity		
Obstacles	Discretized obstacles	Only structured obstacles	GVG defined by the safest path		
Localization	Discrete localization	Arbitrary localization	Localize to nodes		
Exploration	Frontier-based exploration	No inherent exploration	Graph exploration

•Access GVG

Free Space with Topological Map (GVG)

- Access GVGFollow EdgeHome to the MeetPoint
- •Select Edge

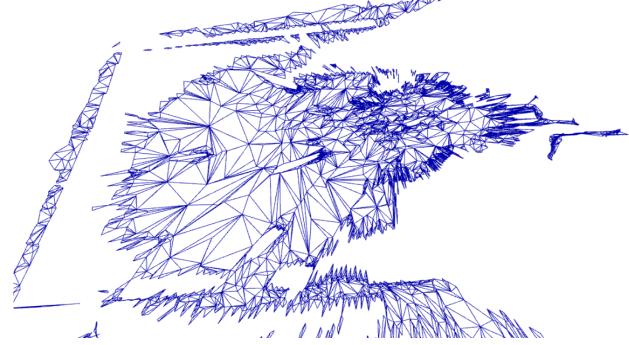

Exploration via Graph Search

- Exhaustive Depth First Search
- Breadth-First Search
- Heuristics

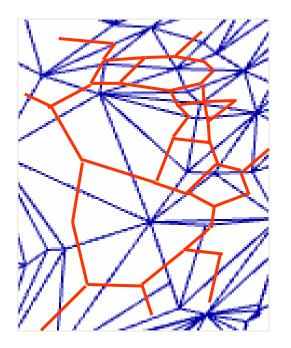

Irregular Triangular Mesh (ITM)

- Terrain Representation
- Underlying Topological Structure
- Path Planning and Exploration

From 2.5D Representation to Topological

Convert ITM into Connected Graph

Start

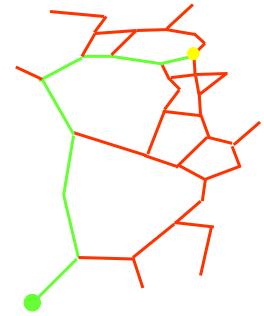

- Convert ITM into Connected Graph
- Planning using Graph Search Algorithms:

Finish

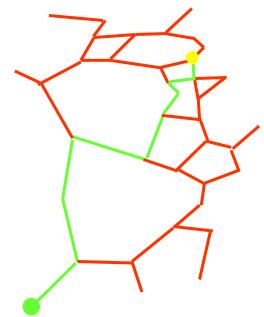

– Dijkstra, A* search algorithms

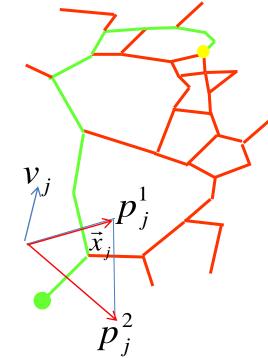

- Convert ITM into Connected Graph
- Path Planning using Graph Search Algorithms:
 Dijkstra, A* search algorithms
- Different Cost Functions Q
 - Number of triangles Q = 1

- Convert ITM into Connected Graph
- Path Planning using Graph Search Algorithms:
 Dijkstra, A*
- Different Cost Functions Q
 - Number of triangles
 - Euclidian distance $Q = \|\vec{x}_i \vec{x}_j\|$

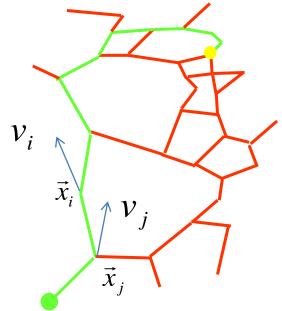

- Convert ITM into Connected Graph
- Path Planning using Graph Search Algorithms:
 Dijkstra, A*
- Different Cost Functions Q
 - Number of triangles
 - Euclidian distance
 - Slope of each triangle $v_j = \frac{p_j^1 \times p_i^2}{\|p_j^1\|\|p_j^2\|}$

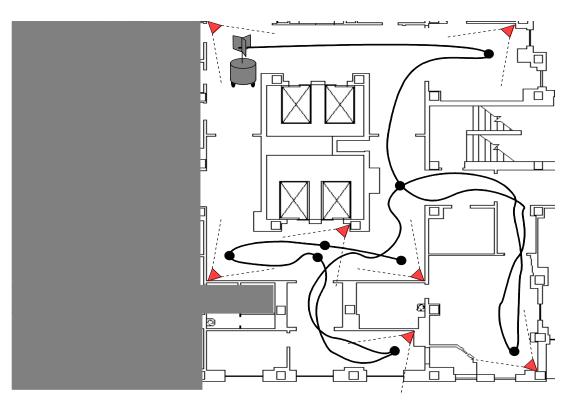

- Convert ITM into Connected Graph
- Path Planning using Graph Search Algorithms:
 Dijkstra, A*
- Different Cost Functions Q
 - Number of triangles
 - Euclidian distance
 - Slope of each triangle
 - Cross triangle slope

Exploration Planning Problem

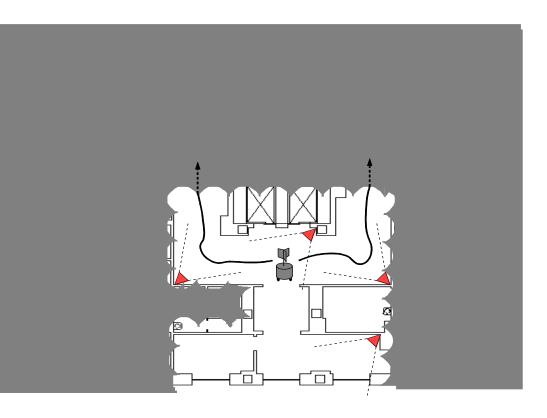

Two fundamental problems for path planning during exploration and mapping:

Exploration Planning Problem

Two fundamental problems for path planning during exploration and mapping:

- Planning for relocalization
- Planning the exploration of new territory

Previous Localization Planning

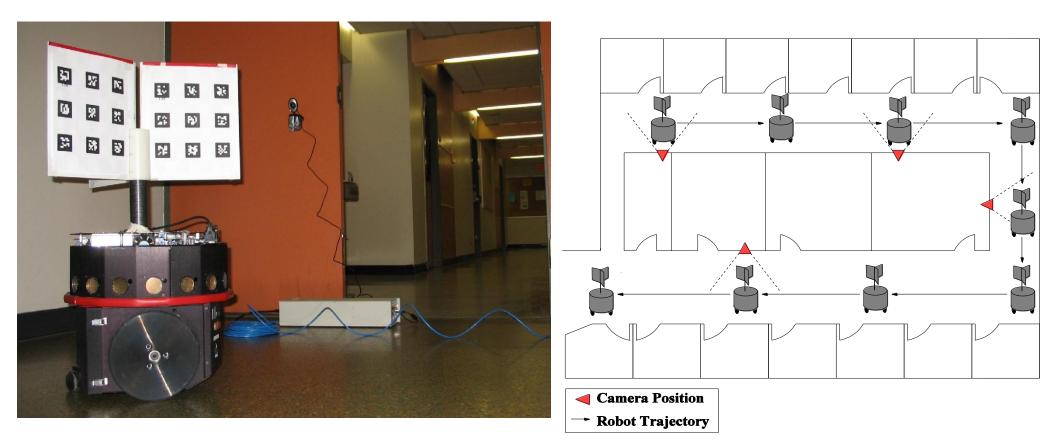

- Reduce measure of map or position entropy
- Variety of graph search planning algorithms (breadth first, A*-search, RRT)
- Evaluate paths with simulation, or Cramer-Rao bounds for expected uncertainty
- e.g. [Fox et al RAS 1998], [Sim and Roy ICRA 2005], [He et al ICRA 2008], [Censi et al ICRA 2008]

Previous Exploration Planning

- Includes motion into unexplored regions
- Typically requires prior knowledge of environment properties or rough layout
- Computation of exploration effects is a challenge
- e.g. [Bourque and Dudek IROS 1999], [Bourgault et al IROS 2002], [Kollar and Roy IJRR 2008]

Exploring a Camera Sensor Network

D. Meger, I. Rekleitis, and G. Dudek. "Heuristic Search Planning to Reduce Exploration Uncertainty", IROS 2008.

Heuristic Search Planning Method

- Solution to exploration planning for camera sensor networks
 - Composed of two alternated steps: exploration and re-localization
 - Combined distance and uncertainty cost function
 - Heuristic search for good paths

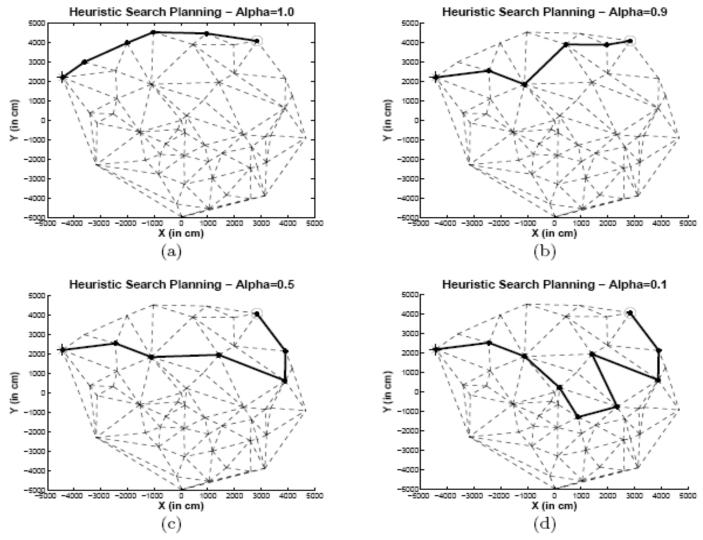

Re-localization Trajectories

• Find a path p which optimizes a weighted cost function between distance and uncertainty: $C(p) = \omega_d \ length(p) + \omega_u \ trace(\Sigma(p))$

$$\omega_d = \frac{\alpha}{maxdist}$$
, $\omega_u = \frac{1-\alpha}{maxuncert}$

 Evaluate possible paths by simulation, approximating measurements with expected values

Effect of α Parameter for Relocalization

CS-417 Introduction to Robotics and Intelligent Systems

Heuristic Search

- Graph search to optimize cost function $C(p) = \omega_d length(p) + \omega_\mu trace(\Sigma(p))$
- Heuristic search allows considering only a fraction of the paths, ordered by expected cost
- Distance-based "cost-to-go" heuristic function *h* used to compute estimated cost

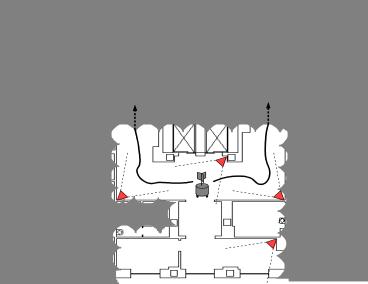

$$C(n) = f(n) + h(n)$$

Estimated cost through n Cost so far

Estimated cost to go

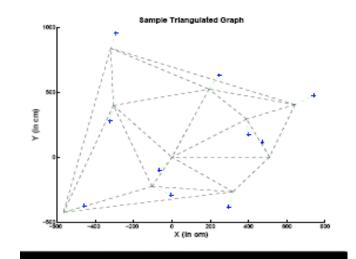

Planning Exploratory Steps

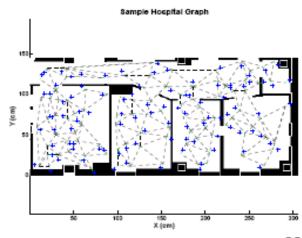

- Choose motion in unexplored space to locate additional camera nodes
- Planner cannot simulate these paths
- Evaluated 2 strategies: 1) nearest camera and 2) a randomly selected camera

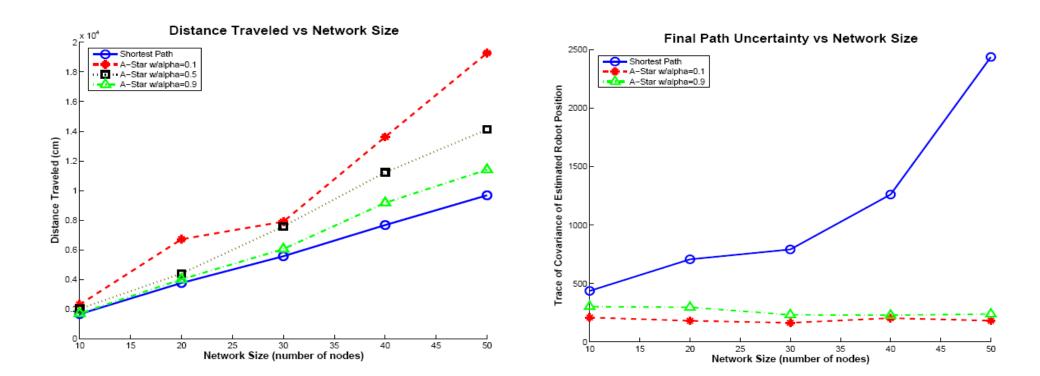

Simulation Results

- Compared planners over many trials
- 3 realistic network types (2 shown)
- 3 methods for comparison:
 - Depth-first
 - Return to origin
 - Return to nearest explored

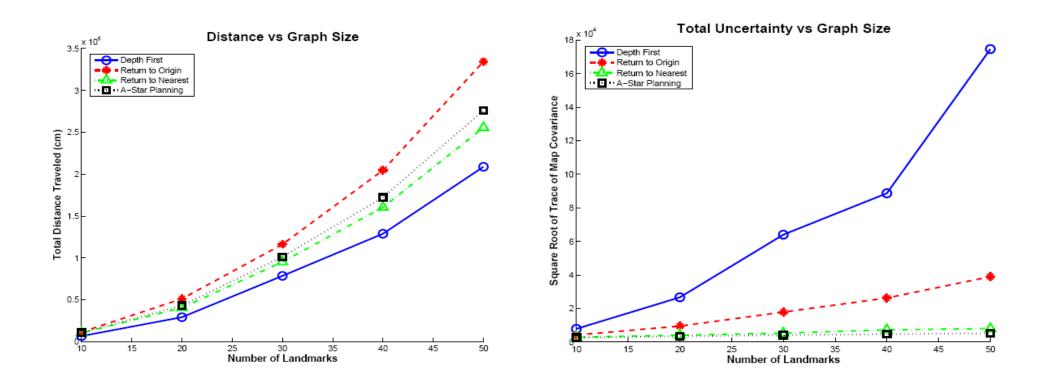

Simulated Relocalization Results

Simulated Exploration Results

Key Points

- Mapping requires exploration
- Exploration strategies depend on the representation
- Topological representations are the most convenient for exploration
- Two objectives:
 - Explore new territory
 - Improve the accuracy by relocalization
